                                                                                                                                                                                                                                                                                                                                                     27-JUL-2000
                                                                                                                                                                                                                                                     RESULT 1
```

```
The specification describes Neisseria meningitidis polypeptides designated BASB047, BASB056, and BASB069. The polynucleotide sequences can be used to create a vector to transform a host cell. The host cell can be used to produce the polypeptide. The polynucleotides and polypeptides can be used in vaccine compositions. The polynucleotides, polypeptides, and antibodies directed against the polypeptides can be used in compositions for preparation of medicaments. The artibodies can also be used in a composition for treating humans with Neisseria meningitidis disease. The diseases that can be treated include upper respiratory tract infection, and invasive bacterial diseases such as bacteremia and meningitis. The nucleic acid sequence can be used as probes in the diagnosis of Neisseria meningitidis disease. The present sequence represents a BASB047 polypeptide.
                                                                                                                                              Neisseria meningitidis BASB047, BASB054, BASB068, and BASB069 proteins, useful for treating N. meningitidis infections, bacteremia, and meningitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TKVIYEEQIQEQATGSRQLADVMAQLIPSLGVSSGTTSNFGQTMHGRQVQFLLNGVPLTG 120

                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used CC of identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in the province of the province cellular proliferation protein.

CC a wide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                           Query Match

The gene cluster is useful for increasing acarbose production in Actinoplanes or other microorganisms or in vitro synthesis systems. This protein is a putative MalF-like membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acbE; acbG; acbF; acbH; maltodextrin transferase; dTDP-glucose synthase; dTDP-Glucose-4,6-dehydratase; C7 sugar cyclase; acarviosyl transferase; alpha amylase; MalF-like membrane protein; MalG-like membrane protein; MalG-like binding protein; acarbose-7-kinase; oxidoreductase;

                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                               This invention describes novel nucleic acid sequences from Actinoplanes sp. SE50/110 (CBS 614.71) designated acbb, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, U, V, W, X, Y and Z, and asp3.1, 3.2 and 3.3, and their homologues. The products of the invention individually or collectively, are used for synthesis or bioconversion of acabose (or its precursors or related substances with alpha-glucosidase inhibiting activity), especially of alpha-glucosidase inhibitors. The products can also be used for optimising/inducing production of such compounds in Actinoplanes or other organisms. This sequence represents a process in the acarbose biosynthesis and bioconversion pathway which is described in the disclosure of the invention.
                                                                                       New nucleic acid sequences from Actinoplanes, useful for synthesis and
bioconversion of acarbose and related inhibitors of alpha-glucosidase

The interaction (PCR) primers, oligomers, and for chromosome polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and game mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to rescore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or guantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and tis binding partners are useful in medical in medical in sections of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in chaptorise, game mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AbdONOIO-ABG30377 represent novel human condition, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical cinaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving abbrrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC diagnostic amino acid sequences of the invention.

CC Mote: The sequence data for this pattent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fire the sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
pustulosis, hypertosis and osteomyelitis), weltis and endophthalmitis.

CP. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory comes associated with acne vulgaris. A method for detecting the gresence or absence of P. acnes in a patient comprises contacting a gample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The compression and activity of P. acnes polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to compregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as completed in a composite a seasy (BLISA).

CR diagnostic agents for determining P. acnes presence, for example, by crayme linked immunosorbent assay (BLISA).

CR Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO can the wine, int/only/miblished not securence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to nucleic acid sequences and the encoded protein of a least part of the surface antigen present on Piscirickettsia salmonis for production of a vaccine with antibacterial activity to protect fish against P. salmonis which causes piscirickettsiosis, also known as salmonid rickettsial septicaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleotide sequence useful in the identification or Lactococcus

The nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent w0200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                               Preparing an agent for diagnosis or control of microbial infection, useful particularly against Helicobacter, based on identification essential genes in defective mutants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       H. pylori HPC188 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAB46371 standard; Protein; 88
This invention describes a novel preparation of an agent (A) for detection, prevention and/or treatment of microbial infection by:
(i) identifying essential genes (I) and corresponding polypeptides (II); (ii) identifying compounds that are directed against (II) and inactivate the microbe; (iii) testing these for suitability for use; and (iv) formulating selected (A). Identifying essential genes (I) comprises preparation of gene-deficient microorganisms by conditional antisense
                                                                                                                                                                                                                                                                                                                                   31-MAY-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibition (CAI) and/or subtractive recombination mutagenesis (SRM), then determining viability and/or survival of the deficient organisms. The products of the invention have antibacterial activity. (A) (which may be a nucleic acid (Ia), vector or host cell containing (Ia), derived polypeptide (IIa), or fragments, (IIa)-specific antibadies or their fragments or an inhibitor of (IIa)) are particularly used for diagnosis, treatment or prevention of infection by Helicobacter pylori. Particularly (Ia) and (IIa) are used in DNA, subunit or live vaccines. The method identifies essential genes, including those that have homologs in other species, so identified (A) should have a broad spectrum of activity. Many gene-deficient cells can be screened quickly, in an automated process, and the identified genes can be used for screening without purification.
polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restrore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating
                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutat responsible for genetic disorders or other traits and to asse biodiversity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerse chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of [II]. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequence of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                   Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity .
                                                                                                                                                                                                                                                                                     ö

The present invention relates to novel plant transcription factors from Eucalyptus grandis or pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetqum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic elix ripper, LIM domain, AP2 and EREBs, zinc finger domains of type 2 cys2His2, CCAAT box elements and MYB.
                                                                                                                                                                                                                                             ö
diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plant; transcription factor; gene expression; eucalyptus; pine; acacia; poplar; sweetgum; teak; mahogany; bZIP; G-box binding factor; basic helix-loop-helix zipper; homeocic; homeodomain; homeobox; MADS; homeodomain zipper; LIM domain; APP; EREBs; zinc finger domain; type 2 Cys2His2; CCAAT box element; MYB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide
                                                                                                                                                                                                                                             ö

                                                                                                                              The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2 cys2His2, CCAAT box elements and MYB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant; transcription factor; gene expression; eucalyptus; pine; acacia; poplar; sweetgum; teak; mahogany; bZIF; G-box binding factor; basic helix-loop-helix zipper; homeotic; homeodomain; homeobox; MADS; homeodomain zipper; LIM domain; AP2; EREBs; zinc finger domain; type 2 Cys2His2; CCAAT box element; MYB.

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. BST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' untranslated the full sequences are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene

The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in disgnostic procedures to identify individuals or in disgnostic procedures to identify the genes corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can also be used for gene therapy to control or treat genetic diseases.

```
The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identify selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebbla), cancer and immune system disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; secreted protein, EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regularory sequence; cyrokine activity; cell proliferation; differentiation; haematopolesis regulation; tissue growth regulation; reproductive hormone regulation; chemocactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                            Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding human secreted proteins - obtained from cDNA libraries derived from liver, lung, large intestine, colon, thyroid and pancress tissue
                                                                                                                                                          New selenoprotein for use in detecting certain viruses, e.g. human immunodeficiency virus (HIV) or Ebola, cancer and immune system
                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                               DB 23; Length 114; . 96;

The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytckine activity, cell proteins obtained may have cytckine activity, reproductive hormone cregulating activity, thesenstatic activity, haematopoissis regulating activity, themotactic/ chemokinetic activity, haematory activity, haematory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromo and gene mapping, and in recombinant production of (II). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, for genetic disorders or other traits to assess biodiversity cresponsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

The present sequence represents a Helicobacter pylori cytoplasmic protein that may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            H. pylori cytoplasmic protein hp1p13939orf13

                                                                                                                                            ö
       and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                              Cytoplasmic, vaccine, prevention, treatment, infection, identification, binding compound, bacterium, life cycle, activator, bacteria, inhibitor, duodenal ulcer disease, chronic gastritis, diagnosis, envelope.
                                                                                                                                            Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a H. pylori cytoplasmic protein.
The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori life cycle activators or inhibitors. overlapping contrasted by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides,
The sequences were analysed for ORF of at least 180 nucleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaccutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1000 or more and cell-cell

                                                                                                                                                                                                                                             The present sequence represents a tryparedoxin peroxidase from Crithidia faciculata. This protein is able to transfer reducing equivalents of trypanthione (T(SH)2), or its disulphide (TS2) to hydrogen peroxide and/or an alkyl hydroperoxide, via a mediator such as tryparedoxin that mediates between T(SH)2/TS2 tryparedoxin peroxidase. Tryparedoxin peroxidase, is used to test for and isolate specific inhibitors of itself. Such inhibitors are potentially useful as trypanocidal agents.
                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                            New tryparedoxin peroxidase - trypanocidal agents
                                                                                                                                                                                                                                                                                                                                                                        WPI; 1998-348515/30.

Codon -cgc- (encoding residue no. 210) is replaced with a STOP codon resulting in the expression of the truncated EC-SOD variant T209 by the plasmid pps7209. The variant polypeptide has the enzymatic activity of native extracellular EC-SOD but no heparin binding activity (EC-SOD class A), improving migration to particular sites in vivo where activity is required and useful when a high activity in plasma or interstitial fluid is important. See also AAR11536-R11544.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T213 by the plasmid pPST213. The variant polypeptide has the enzymatic activity of native extracellular EC-SOD but no heparir binding activity (EC-SOD class A), improving migration to particular sites in vivo where activity is required and useful when high activity in plasma or interstitial fluid is important.
                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invent: useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG1840-ABL16175) and the encoded proteins
                                                   The sequence data for this patent did not form specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                               The sequence is prepd. by mutagenesis of human EC-SOD type C cDNA. Codon -gag (encoding residue no. 216) is replaced with a STOP codon resulting in the expression of the truncated EC-SOD variant T215 by the plasmid pBST215. The variant polypeptide has the enzymatic activity of native extracellular EC-SOD but no hepatin binding activity (EC-SOD class A), improving migration to particular sites in vivo where activity is required and useful when a high activity in plasma or interstitial fluid is important.
                                                                                                                                                                                                                                                                                                                         Extracellular super oxide dismutase variants (EC-SOD) - for treatment of conditions associated with super oxide radicals such as ischaemia and inflammatory diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is prepd. by mutagenesis of human EC-SOD type C cDNA. Codon -agc (encoding residue no. 217) is replaced with a STOP codon resulting in the expression of the truncated EC-SOD variant T216 by the plasmid ppST216. The variant polypeptide has the enzymatic activity of native extracellular EC-SOD but slightly reduced affinity for heparin (it is still EC-SOD but slightly improving migration to particular sites in vivo where activity is required and useful when a high activity in plasma or interstitial fluid is important.
                                                                                                                                                                                                                                                                                                                                                 Extracellular super oxide dismutase variants (EC-SOD) - for treatment of conditions associated with super oxide radicals such

Codoms -gag agc- (encoding residues no. 214-215; Glu-Ser) are replaced with -gcg tga- encoding an Ala residue followed by a STOP codom. This results in the expression of the variant SAT216, by plasmid pPSSAT216 which has a higher net positive charge than the native polypeptide. The variant has the enzymatic activity of native polypeptide but has higher affinity for heparin. This is useful where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extracellular super oxide dismutase variants (EC-SOD) treatment of conditions associated with super oxide r as ischaemia and inflammatory diseases.
                                                The sequence is prepd. by mutagenesis of human EC-SOD type C cDNA. Codon -tgc- (encoding residue no. 219; Cys) is replaced with -gcc-encoding an Ala residue, resulting in the loss of a disulphide bridge which maintains the structure of the C-terminal. This has no effect on the heparin affinity of the variant as expressed by the plasmid pPSSA219 which also has the enzymatic activity of native
                                                                                                                                                                      Extracellular super oxide dismutase variants (EC-SOD) treatment of conditions associated with super oxide rase ischaemia and inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                              The sequence is prepd. by mutagenesis of human EC-SOD type C cDNA. Codon -gag- (encoding residue no. 216; Glu) is replaced with -gcg-encoding an Ala residue, resulting in a greater net positive charge. The variant, SA216, expressed by the plasmid pbsSA216 has the enzymatic activity of native extracellular EC-SOD and a greate; affinity for heparin than the native EC-SOD class C, useful for

                                                                                                                                                                                                                                          Convenue 18 prepd. by mutagenesis of human EC-SOD type C cDNA. Codon asc. (encoding residue no. 89; Asn) is replaced with -casencoding a Gln residue, resulting in a glycosylation-free variant. The variant, Gl, expressed by the plasmid pPSG1, has the enzymatic activity of native polypeptide but has an increased affinity for heparin: This may be due to the fact that the CHO substituent carries a considerable negative charge which may repel the enzyme from the strongly negatively charged heparin. The increased affinity is useful eg for organ transplantation.
                                                                                                          Extracellular super oxide dismutase variants (EC-SOD) - for treatment of conditions associated with super oxide radicals such as ischaemia and inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human extracellular superoxide-dismutase (SOD) partial sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prodn. of recombinant human extracellular superoxide dismutase using transgenic mammals to express the polypeptide and useful variants combined as hybrids with a milk protein in the mammary gland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1.8%; Score 7; DB 12; Length 222;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is prepd. by mutagenesis of human EC-SOD type C cDNA. Codon -aag- (encoding residue no. 220; Arg) is replaced with -gcg-encoding an Ala reseilue, resulting in a decrease in the net positive charge. The variant, $A220, expressed by the plasmid pPSSA220, has the enzymatic activity of native polypeptide but has a slightly reduced affailty for heparin. This is useful where migration to a paticular site in vivo is required or high levels of See also AAR11535-R11544.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
The sequence given is enzymatically active purified extracellular superoxide dismutase (EC-SOD). It is produced from insol. inactive aggregates containing recombinant EC-SOD by treating the insol. active aggregates under a chaotropic environment or reducing conditions until the EC-SOD, in the form of a solubilised monomer is formed and recovered, refolding the monomeric EC-SOD recovered into an active EC-SOD and purifying the refolded active EC-SOD. EC-SOD is a 91/coprotein which consists of four subunits and has a sugar chain of approx. 135kD. It has four copper and four zinc ions per molecule. The EC-SOD produced in this invention has a high enzymatic activity of 3000 unit/mg of protein or more. This EC-SOD
                                                                                                                                                                                                                                                                                                                    Akashi H,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This protein may be expressed (using plasmid pS172) in the mammary gland of an adult female of a non-human mammal harboring a SOD gene-milk protein gene regulatory element hybrid gene. The protein may be used for the diagnosis, prophylaxis and treatment of diseases or disorders related to the presence of superoxide radicals. It may also be used essentially for the same applications as CUZn SOD. The protein may also be useful in commetics, e.g. to prevent skin ageing and protect against radiation damage. Modified proteins may be produced from this sequence which have increased/decreased heparin affinity.
                                                                                                                                                                               Disclosure; Page 8-9; 20pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid encoding a Staphylococcus epidermidis polypeptide, useful for diagnosing and treating bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-AUG-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                  The presence of a mutation in a gene encoding a superoxide dismutase (SOD1, SOD2 or SOD3) indicates an increased likelihood of developing a cell death disease, specifically a neurodegenerative disease. The use of SOD polypeptides to treat amyotrophic lateral sclerosis and diseases involving a deleterious mutation in the glutathione peroxidase-encoding gene, the catalase-encoding gene and the nitric oxide-encoding gene is claimed. The specification includes the sequences of human SOD1, hSOD2 and hSOD3 (AAR61336-AAR61338, respectively).
                                                                                                                                                                                                                                  Diagnosis, treatment and prevention of diseases of cell death - e.g. amyotrophic lateral sclerosis, which are the result of e.g. decreased SOD activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Super:oxide dismutase mimetic(s) comprising a nitrogen-containing macrocyclic moiety - useful in treatment of inflammation, musculature disorders, atherosclerosis or gout.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Clone 7 from a human adult leukocyte genomic library was analysed. The analysis revealed that human EC-SOD contains three exons and two introns. The identification of the signal peptide cleavage site is consistent with computer algorithms which predict the site of eukaryotic signal peptide cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oxidant scavenger; extracellular matrix targetting moiety; cell surface matrix; nitrogen containing macrocyclic moiety; inflammatory condition; aberrant smooth muscle function; ischaemia reperfusion injury; myocardial infarction; stroke; acute head trauma; organ repetusion; bowel ischaemia; pulmonary infarction; glaucoma; EC-SOD; superoxide dismutase; tetrameric glycosylated copper and zinc containing enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ischaemia, pulmonary infarction, surgical occlusion of blood flow, and soft tissue injury. They can further be used to protect against damage to the eye due to sunlight (and to the skin) as well as glaucoma, and macular degeneration of the eye. Diseases of the bone are also amenable to treatment with the compounds, and connective tissue disorders associated with defects in collagen synthesis or degradation can be treated with defects in collagen synthesis or degradation can be selected to render them resistant to degradation by haemoxygenase and also so that they do not interfere with normal porphyrin metabolism, can pass through cell membranes and bind to cell surface or extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EC-SOD, a tetrameric glycosylated copper and zinc containing superoxide dismutase enzyme. The oxidant scavengers can be used for protecting against the deleterious effects of oxidants and for modulating biological processes involving oxidants. They can be used for e.g. treating inflammatory conditions, treating disorders resulting from aberrant smooth muscle function or to protect against ischaemia reperfusion injuries associated with myocardial infarction, bowel ischaemia, pulmonary infarction, surgical occlusion of blood flow, and ischaemia, pulmonary infarction, surgical occlusion of blood flow, and
                                                                                                                                                                                                                                                                                                                                                                                                             SOD1; SOD2; SOD3; Cu/Zn; superoxide dismutase; mitochondrial; treatment; extracellular; neurogenerative disease; amyotrophic lateral sclerosis; familial; ALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       macrocyclic molety and a cell surface or extracellular matrix tary molety, or their salts. The present sequence represents the human EC-SOD, a tetrameric glycosylated copper and zinc containing super
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1997-077220/07

This protein can be used in a method for treating a neurodegenerative disease particularly familial amyotrophic lateral sclerosis (ALS).

Sequence 6, Application US/08249013.

Patent No. 5643754.

GENERAL INFORMATION

TITLE OF INVENTION: CLONED leptospira OUTER MEMBRANE PROTEIN

NUMBER OF SEQUENCES: 10

NUMBER OF SEQUENCES: 10

STREET: 1880 Century Park East, Suite 500

CITY: Los Angeles

STREET: 1880 Century Park East, Suite 500

CITY: Los Angeles

STATE: California

COUNTRY: UGA

ZIP: 90067

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: Ploppy disk

COMPUTER: SS-MAY-1994

CLASSIFICATION NUMBER: US/08/249,013

FLING SYSTEM: NS-MAY-1994

CLASSIFICATION NUMBER: PD-3602

REFERENCE/DOCKET NUMBER: PD-3602

TELECOMMUNICATION INFORMATION:

REFERENCE (199) 455-5100
